

Project Title

Node.js Web Application Deployment Using AWS Elastic Beanstalk

Description

- Developed and deployed a **Node.js web application** using **AWS Elastic Beanstalk**, a Platform as a Service (PaaS) offered by Amazon Web Services.
- Configured the Elastic Beanstalk environment, selected the Node.js platform, created the application environment, and deployed the application.
- Elastic Beanstalk automatically provisioned AWS resources such as EC2 instances, load balancing, monitoring, and scaling, simplifying the deployment and management process.

Technologies Used

- Amazon Web Services (AWS)
- AWS Elastic Beanstalk
- Node.js
- Amazon EC2
- IAM
- CloudWatch
- Git (optional)

Key Features

- Created an Elastic Beanstalk application.
- Configured a Node.js web server environment.
- Selected the Amazon Linux platform with Node.js runtime.
- Configured service roles and EC2 instance profile.
- Deployed the application using Elastic Beanstalk.
- Automatically provisioned AWS infrastructure.
- Managed application deployment, monitoring, and scaling.
- Accessed the application using the Elastic Beanstalk environment URL.

Project Workflow

1. Created an Elastic Beanstalk application.
2. Selected the Node.js platform.
3. Configured the application environment.
4. Configured IAM service roles and EC2 instance profile.
5. Deployed the application.
6. Elastic Beanstalk automatically created the required AWS resources.
7. Verified the application through the generated environment URL.

Outcome

Successfully deployed a Node.js web application using AWS Elastic Beanstalk. The project demonstrates practical knowledge of cloud application deployment, environment management, automatic infrastructure provisioning, monitoring, and scalable application hosting on AWS.
